

Keep the outdoors truly outside ...

It's a noisy world.

From the neighbors who mow at 6 am each Saturday, the earth-shaking sound of motorcycles rumbling by, or a constant symphony of neighborhood dogs barking, to the noise pollution from a 747 aircraft, uninvited sound seems to be ever present in today's homes.

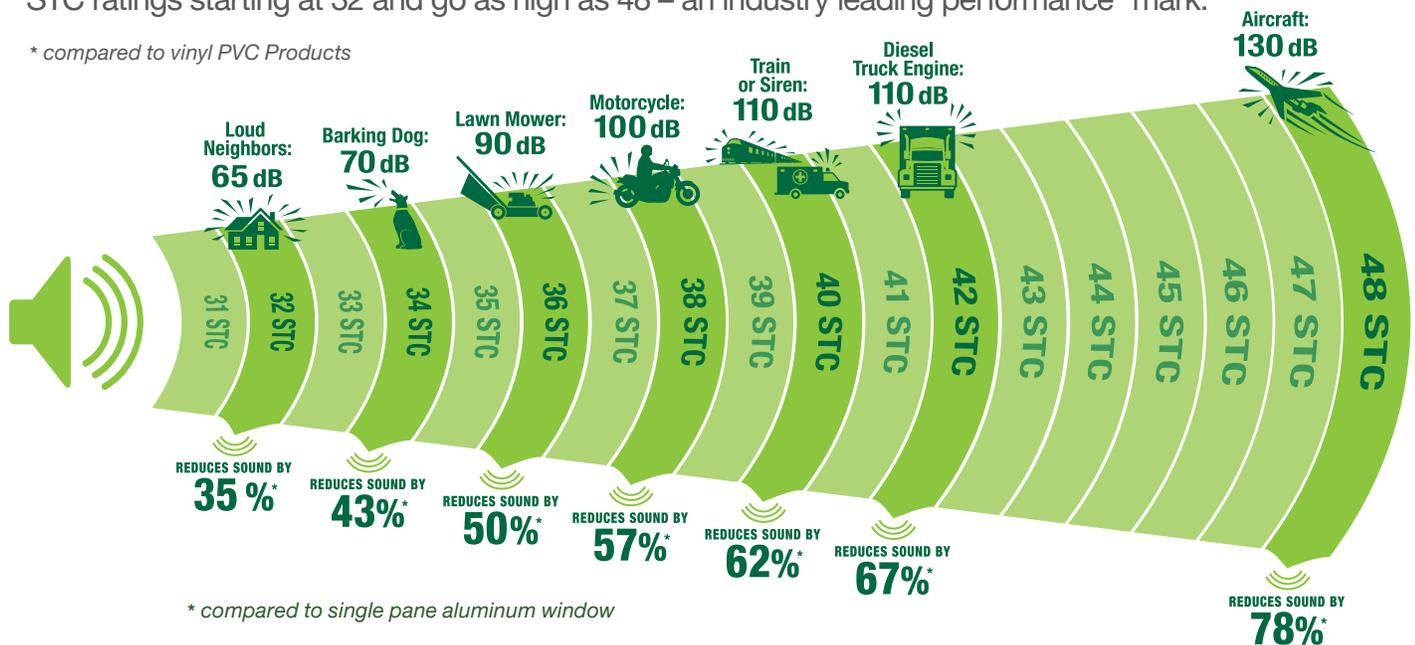

But what can you do?

You can't move. You need a solution. Noises are made up of sound waves caused by vibrations. These waves carry noise into your home through windows and doors that perform poorly. Silent Guard® products dramatically limit these sound waves with multiple glass packages available to meet each need with an economical solution.

Silent Guard windows and doors are a way to keep the frequent and unwelcome noises out.

Sounds are measured in decibels (dBs). An STC rating is assigned to a window or door to designate its capacity to block sound. Simply put, the higher the decibel the higher the STC rating needed. Typical windows have STC ratings in the 25-28 range. By comparison, Silent Guard products have STC ratings starting at 32 and go as high as 48 – an industry leading performance* mark.

* compared to vinyl PVC Products

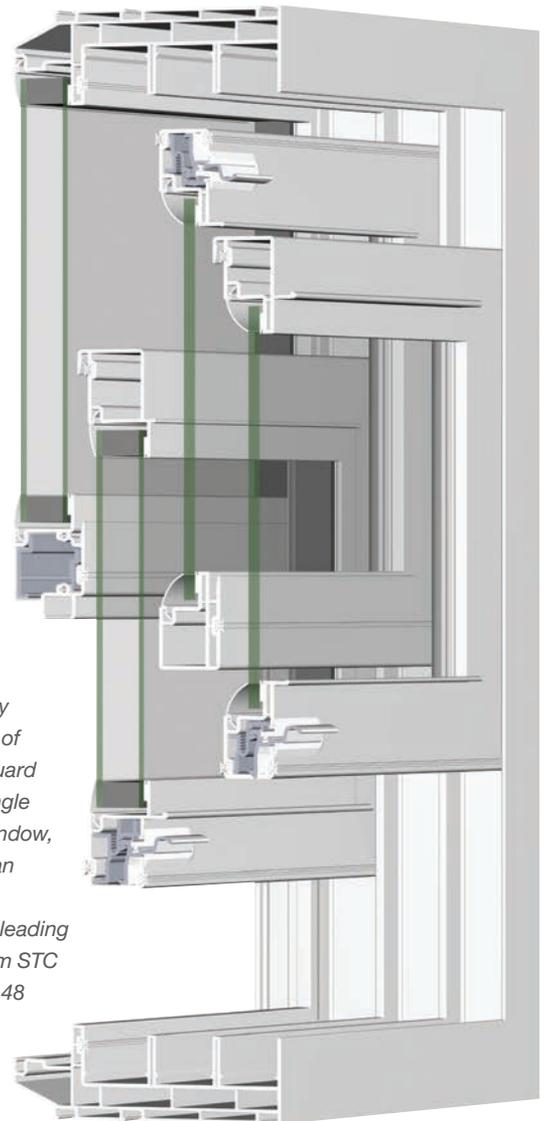

Silent Guard's unique multi-chamber frame and multiple sash assemblies improve thermal performance while delivering maximum sound control.

Silent Guard windows and doors work to minimize the impact of noise attacking your home.

Because sounds vary in volume and annoyance, Sound Transmission Class (STC) numbers are assigned to a window or door to make it easy to select the right performance level for each application and budget. Silent Guard products are engineered to provide an STC rated window needed to keep the sounds of a moderate highway from invading your privacy, all the way up to a maximum STC rated 48 window that is designed for homes near airports where the sound can be deafening. Matching the right STC rating with the desired window style ensures your home yields the optimum performance for your budget and your specific sound control need.
